## SurfPoint® s web based software solution

### The technology

SurfPoint's software solution is based on a client – server architecture. As such, it may identify and address every registered terminal individually. The built-in grouping function enables efficient management of as many associated terminals as required.

### The benefit

SurfPoint's web-based interface allows supervision of all terminals from every internet-capable PC. To ensure authenticity, login and password are required.

### Information – and internet – terminal in one

The terminals may be considered as advertising platforms. Specific information can be timed to be published on either one or an entire group of terminals. More specifically, if the terminal is not in use, the monitor will show your customised publicity.
